

Sepax Monomix H2P SAX Tween Quantification

Monomix H2P SAX, 2.1 x 20 mm SS

Part Number: 282640990-2102

Monomix H2P SAX, 2.1 x 50 mm SS

Part Number: 282640990-2105

Summary

- Monomix H2P-SAX columns are designed to effectively quantify neutral amphiphilic surfactants, such as Tween 80, Tween 20, and Poloxamers, which are commonly present in formulated biological samples, such as Monoclonal Antibodies.
- In this study, Erbitux and Tween 20 and Tween 80 mixtures were analyzed as an example to demonstrate the effectiveness of tween quantification by Monomix H2P-SAX column. The calibration range and capacity of Tween 20/80 were also analyzed on Monomix H2P-SAX column, respectively:
 - Tween 20: Calibration range 0.0016%- 0.0250%; Calibration range up to 0.0125 µg.
 - Tween 80: Calibration range 0.0010%- 0.0156%; Calibration range up to 0.0078 µg.
 - As you go above the CMC of Tween, micelles will form in solution. Dilution of sample is suggested for high concentration Tween quantification.
(Larger column sizes are available if higher capacity is needed)
- Monomix H2P-SAX columns are more hydrophilic than other surfactant quantification column brands on the market. 10% IPA which is commonly used in the binding condition to reduce hydrophobic interaction, is not needed in the binding condition of Monomix H2P-SAX.
- With a narrow size distribution ($D_{90}/D_{10} < 1.3$), Monomix H2P-SAX column offers higher separation and better peak shape than other vendors.

Technical Specification

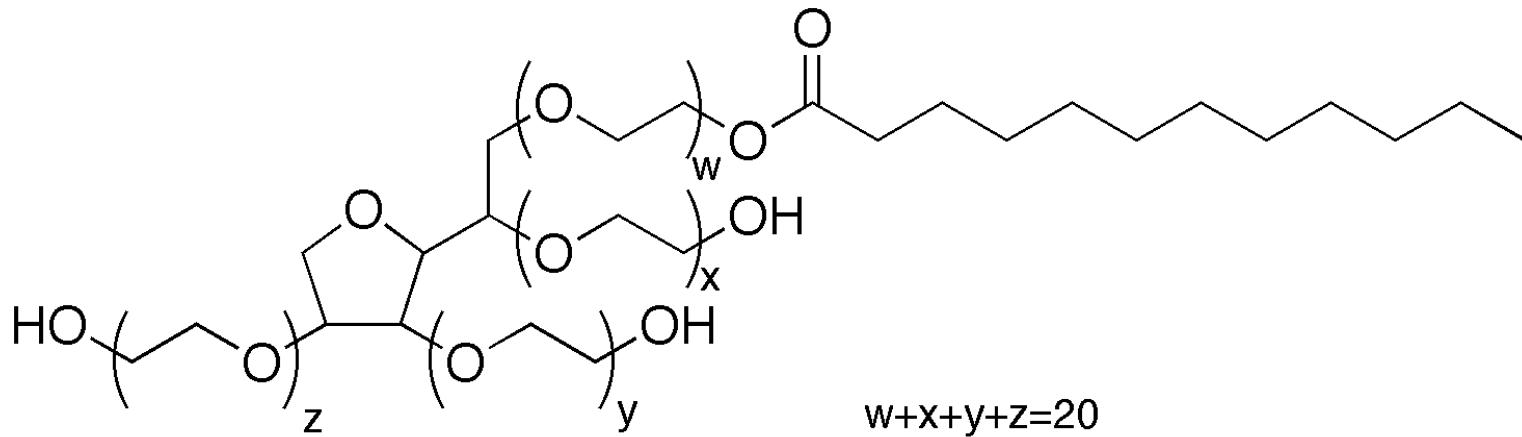

Application:	Surfactant quantification
Brand:	Monomix H2P-SAX
Part Number:	282640991-2102
Chemistry:	Mixed-Mode
Ion exchange capacity:	0.5 meq/gram
Mass Spec. Compatibility:	Yes
Particle Size:	40 µm
pH Stability:	1-13
Operating Temperature Limit:	80 °C
Operating Pressure Limit:	3,000 psi
Flow Rate:	0.1-1 mL/min
Mobile Phase Compatibility:	Aqueous solvents, organic solvents, or their mixtures

Experimental Method

Mobile Phase	A: 2% formic acid in water B: 2% formic acid in IPA
Instrument:	HPLC
Detector:	ELSD
Column Temperature	23 °C
Flow Rate:	1.00 mL/min
Injection Volume:	50 µL
Column Pressure Range:	40-125 bar

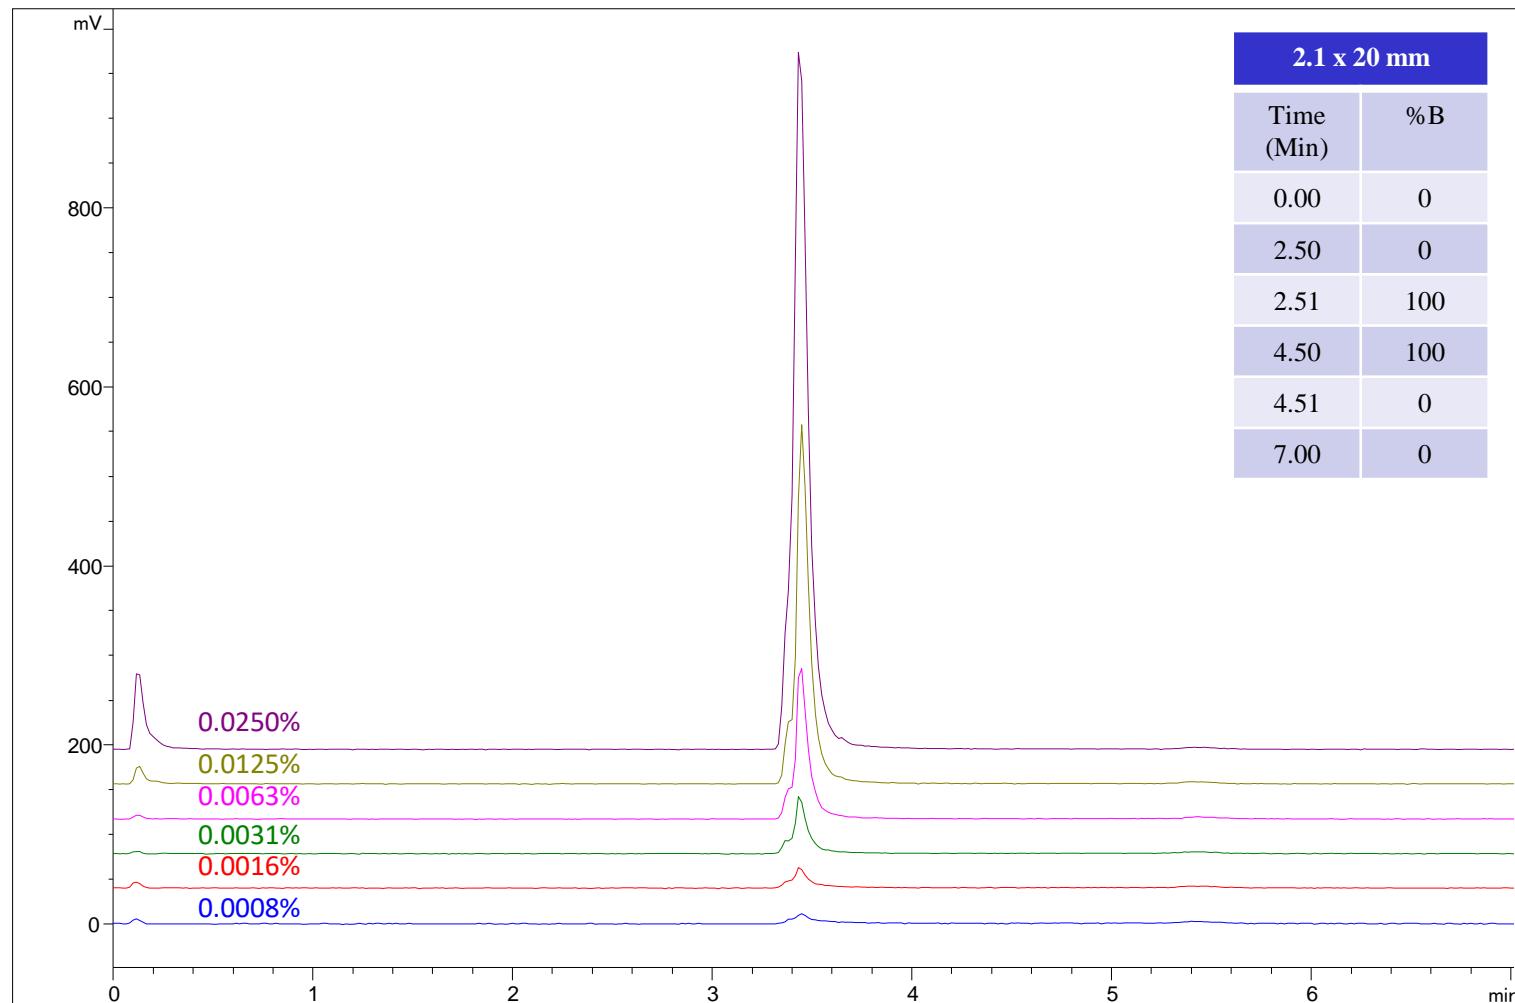

Tween 20 Structure

Tween 20 is a mixed population sample.

Quantification of Tween 80 in Erbitux by Monomix H2P SAX

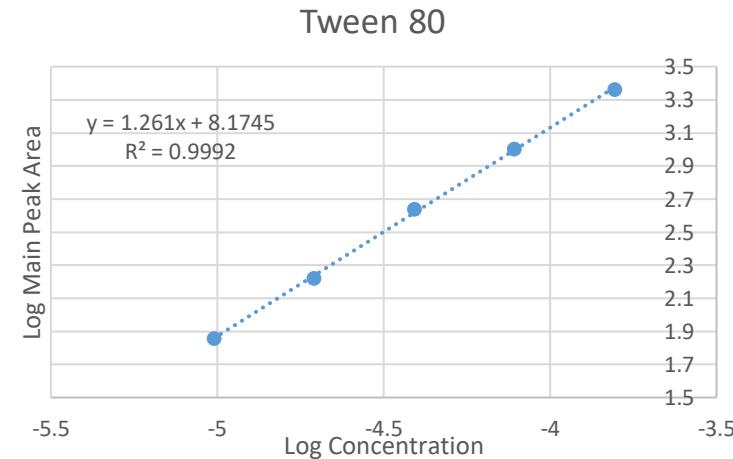

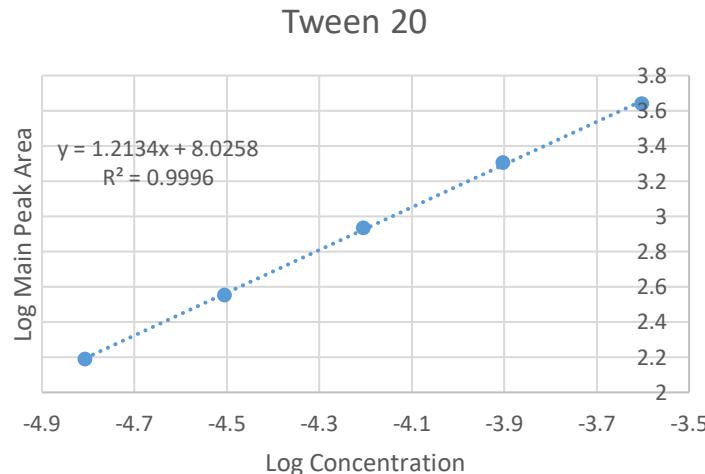

Sample: 0.01 mg/mL Erbitux, 0.01 mg/mL Erbitux + 0.008% Tween 80

Tween 20 vs Tween 80 Capacity

Tween 80 capacity lower than Tween 20 capacity on Monomix H2P-SAX may be due to:

1. Tween 80 forms micelle at a lower concentration than Tween 20.
2. Tween 80 micelle is larger than Tween 20 micelle, and the Monomix H2P-SAX resin is porous.

Tween 20 Calibration range up to 0.0125 µg

5	0.0156%	369.7	2298.8

Understanding Tween Micelles

As you go above the CMC of Tween, micelles will form in solution. As the hydrophobic functional groups are encapsulated inside of the micelle, possibly micelles will not bind to the Monomix H2P-SAX resin with the same affinity as free Tween. Dilution of sample is suggested for high concentration Tween 20/80 quantification on Monomix H2P-SAX column.

- ❖ Tween 80 form micelle at 0.00157% w/v in water.¹
- ❖ Tween 20 form micelle at 0.006% w/v in water.^{2,3}
